The polypeptide is useful in the preparation of vaccines against B. pertussis, B. parapertussis, B. bronchiseptica and other infectious diseases of mammals including diphtheria, tetanus, pollo and infections caused by Haemophilus influenza b. The polypeptide is especially useful for eliciting an immune response against Bordetella sp. Antibodies against the polypeptide may be used for pharmaceutical and/or diagnostic purposes, particularly for treating or preventing infections caused by Bordetella pertussis or Bordetella parapertussis. The present sequence is B. pertussis or Bordetella parapertussis.

  New polypeptides derived from Bordetella pertussis pertactin, useful a vaccine against infections caused by Bordetella strains, and other infectious diseases of mammals, e.g. diphtheria, tetanus, or polio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to polypeptides derived from Bordetella pertussis pertactin (Prn1). The polypeptide is useful in the preparation of vaccines against B. pertussis, B. parapertussis, B. bronchiseptica and other infectious diseases of mammals including diphtheria, tetanus, polio and infections caused by Haemophilus influenza b. The polypeptide is especially useful for eliciting an immune response against Bordetella sp. Antibodies against the polypeptide may be used for pharmaceutical and/or diagnostic purposes, particularly for treating or preventing infections caused by Bordetella pertussis or Bordetella parapertussis. The present sequence is maltose binding protein (MBP)-pertactin region I fusion protein used in the exemplification of the invention.

The invention relates to polypeptides derived from Bordetella pertussis pertactin (Prn1). The polypeptide is useful in the preparation of vaccines against B. pertussis. B. parapertussis, B. bronchiseptica and other infectious diseases of mammals including diphtheria, tetanus, polio and infections caused by Haemophilus influenza b. The polypeptide is especially useful for eliciting an immune response against Bordetella sp. Antibodles against the polypeptide may be used for pharmaceutical and/or diagnostic purposes, particularly for treating or preventing infections caused by Bordetella pertussis or Bordetella parapertussis. The present sequence is maltose binding protein (MBB)-pertactin region I fusion protein used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                              WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to polypeptides derived from Bordetella pertussis pertactin (Prn1). The polypeptide is useful in the preparation of vaccines against B. pertussis B. parapertussis. B. bronchiseptica and other infectious diseases of mammals including diphtheria, tetanus, polio and infections caused by Haemophilus influenza b. The polypeptide is especially useful for eliciting an immune response against Bordetella sp. Antibodies against the polypeptide may be used for pharmaceutical and/or diagnostic purposes, particularly for treating or preventing infections caused by Bordetella pertussis or Bordetella parapertussis. The present sequence is maltose binding protein (MBB)-pertactin region 1 fusion protein used in the exemplification of the invention.
                                                                                                                                                                                                                                    New polypeptides derived from Bordetella pertussis pertactin, useful a vaccine against infections caused by Bordetella strains, and other infectious diseases of mammals, e.g. diphtheria, tetanus, or pollo

                                                                                                                                                                Differentiation of cells in culture (partic. for tissues or for embryogenesis and/or organogenesis) is promoted by adding to the culture medium at least one lipid transfer protein (LTP) or its analogue. LTP are used to produce somatic plant embryos from somatic cell cultures in vitro, esp. of vine cells (including transformed cells). They can also be used in other biological systems where lipid transfer/differentiation is required. LTP can induce differentiation even under otherwise non-permissive
                                                                                                                    conditions (presence of auxin). LTP is esp. one of the four proteins given in AAR56849-52, and is esp. derived from the same species as the cells being cultured. LPF from carrot, spinach, millet, maize, barley or rape can also be used (see AAR56853-58).
                                                                                                                                                                                                                                                                                                        Inducing differentiation of cultured cells with lipid transfer protein - esp to produce somatic plant embryos, also new proteins, DNA and oligo-nucleotide probes.
                                                                                                                                                                                                                                                                                  Claim 15; Fig 1; 36pp; French.

                                                                                                              Differentiation of cells in culture (partic. for tissues or for embryogenesis and/or organogenesis) is promoted by adding to the culture medium at least one lipid transfer protein (LTP) or its analogue. LTP are used to produce somatic plant embryos from somatic cell cultures in vitro, esp. of vine cells (including transformed cells). They can also be used in other biological systems where lipid transfer/differentiation is required. LTP calliduce differentiation even under otherwise non-permissive conditions (presence of auxin). LTP is esp. one of the four proteins given in AAR56849-52, and is esp. derived from the same species as the cells being cultured. LTP from carrot, spinach, millet, maize, barley or rape can also be used (see AAR56853-58).
                                                                                                                                                                                                                                                                                                    Claim 15; Fig 1; 36pp; French.
                                                                                                                                                                                                                                                                                                                             Inducing differentiation of cultured cells with lipid transfer protein - esp to produce somatic plant embryos, also new proteins, DNA and oligo-nucleotide probes.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         seq length: 0 seq length: 2000000000

                                     Submitted (JAN-1999) to the SWISS-PROT data bank.

-I- FUNCTION: PLANT NONSPECIFIC LIPID-TRANSFER PROTEINS TRANSFER PHOSPHOLIPIDS AS WELL AS GALACTOLIPIDS ACROSS MEMBRANES. MAY PLAY A ROLE IN WAX OR CUTIN DEPOSITION IN THE CELL WALLS OF EXPANDING EPIDERMAL CELLS AND CERTAIN SECRETORY TISSUES.

-I- SIMILARITY: BELONGS TO THE PLANT LTP FAMILY.
                                                                                                                                               Conti A., Baroglio C., Monza M., Ortolani C., Scibola Giuffrida M.G., Fortunato D., Farioli L., Pravettoni Ansaloni R., Napolitano L., Pastorello E.A.;

ISOCORMS OF 11pld-transfer proteins.";
EUR. J. BIOCHEM. 217:885-889(1993).
1- FUNCTION: PLANT NONSPECIFIC LIPID-TRANSFER PROTEINS TRANSFER
PHOSPHOLIPIDS AS WELL AS GALACTOLIPIDS ACROSS MEMBRANES. MAY PLAY
A ROLE IN WAX OR CUTIN DEPOSITION IN THE CELL WALLS OF EXPANDING
EPIDERMAL CELLS AND CERTAIN SECRETORY TISSUES.
1- SIMILARITY: BELONGS TO THE PLANT LIP FAMILY.

Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: PLANT NONSPECIFIC LIFLID-TRANSFER PROTEINS TRANSFER PHOSEPHOLIPIDS AS WELL AS GALACTOLIPIDS ACROSS MEMBRANES. MAY PLAY A ROLE IN WAX OR CUTIN DEPOSITION IN THE CELL WALLS OF EXPANDING EPIDERWAL CELLS AND CERTAIN SECRETORY TISSUES.

-I- SIMILARITY: BELONGS TO THE PLANT LTP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DISULFID
